A semiconductor device typically includes one or more functional devices, such as a processor and a memory device, and a number of metal conductive paths for electrically coupling the functional devices to other devices and circuits. The metal conductive paths are generally defined by a material, such as copper, which can be formed into desired paths using known photolithography and etching techniques. As semiconductor technology has advanced, the semiconductor device has become increasingly dense and the number of metal conductive paths within the semiconductor device has increased. However, as the number of metal conductive paths within the
